

# Exploration of the impact of uncertainty in atomic physics rates on the plasma

David Coster<sup>1</sup>

*<sup>1</sup>Max Planck Institute for Plasma Physics (IPP), Garching, Germany*

The EasyVVUQ framework has been used to explore the impact of uncertainty in the ionization and recombination rates on the resultant plasma state in a simple coronal model. If this is felt to be of broader interest, the impacts could be examined in the future in an edge/SOL transport code.
