

# Charge transfer processes in atom-molecule collision experiments

#### Paulo Limão-Vieira, F Ferreira da Silva and G García

Department of Physics, Universidade NOVA de Lisboa, Portugal and Consejo Superior de Investigaciones Científicas (CSIC), Madrid, Spain

IAEA Technical Meeting Vienna, 20 December 2016

#### The Atomic and Molecular Collisions Laboratory

- Asst. Prof. Filipe Ferreira da Silva
- Dr. Krystyna Regeta, Post-Doc
- PhD students:
- Mr. Tiago Cunha, PT
- Ms. Emanuele Lange, BR
- Ms. Mónica Mendes, PT
- Ms. Alexandra Loupas, PT
- Ms. Rebeca Meißner, D

#### <u>Technicians</u>:

Mr. João Faustino

Mr. Afonso Moutinho

Funding through several schemes:

#### **Our most close collaborations**

CSIC – Madrid, ES

Gustavo García

University of Innsbruck, AT

Paul Scheier

Stephan Denifl

Sophia University – Tokyo, JP

Hiroshi Tanaka

Masamitsu Hoshino

Flinders University, AU

**Michael Brunger** 

Université de Lyon, FR

Marie Christine Bacchus

Czech Academy of Sciences, CZ

Juraj Fedor

#### Data for plasma applications

- Elastic DCS; ICS; Total Cross Sections (experiment and theory);
- Electronic Excitation (experiment and theory) / high-resolution VUV spectroscopy
- Japan-Portugal-Spain-Australia (from 2003):

GeF<sub>4</sub>; SiF<sub>4</sub>, CF<sub>4</sub>; BF<sub>3</sub>; C<sub>4</sub>F<sub>6</sub>; CF<sub>3</sub>Cl; CF<sub>2</sub>Cl<sub>2</sub>; CFCl<sub>3</sub>; 1,3-C<sub>4</sub>F<sub>6</sub>, c-C<sub>4</sub>F<sub>6</sub> and 2-C<sub>4</sub>F<sub>6</sub>; CCl4; F<sub>2</sub>CO; C<sub>2</sub>F<sub>4</sub>

COS; CS<sub>2</sub>;H<sub>2</sub>O; CH<sub>4</sub>; SiH<sub>4</sub>; GeH<sub>4</sub>; C<sub>6</sub>H<sub>6</sub>; CH<sub>3</sub>F; CH<sub>3</sub>Cl; CH<sub>3</sub>Br; CH<sub>3</sub>I; O<sub>2</sub>

• UK-Portugal (2006):  $CF_3I$ ,  $C_2F_4$  and  $CF_x$  (x = 1 - 3) radicals

## **Overview**

Motivation Introduction	<ul> <li>Negative ion formation</li> </ul>
	electron transfer
	ion-pair formation
Experimental set-up	
Results	
	<ul> <li>acetic acid</li> <li>pyrimidines</li> <li>nitromethane</li> </ul>
Conclusions	meenane

## **Motivation**

#### **Collisional ionisation processes between atoms A and molecules BC**

# **Motivation**

#### **Negative ions formation from molecular targets**

#### **Electron transfer in atom-molecule collisions:**

- Studying chemical reactions understand radiation induced damage;
- Collisional excitation and dissociation;
- Site- and bond-selectivity (pyrimidines, purines, imidazole);
- The role of the collision complex pathways;
- Competitive (even concerted) fragmentation mechanisms in pyrimidines and purines.

# **Motivation**

- access to parent molecular states which are not accessible in EA (states positive EA);
- role of vibrational excitation of the parent neutral molecule collision dynamics

## $K + CH_3NO_2$ and $K + CD_3NO_2$

uncertainty ≈ 20%

# Conclusions

- site- and bond-selective mechanism in purines;
- the electron donor can greatly affect the chemical pathways of the reaction (e.g. CH<sub>3</sub>NO<sub>2</sub>);
- compared to an isolated TNI formed by free electron capture, the anion in the vicinity of a K<sup>+</sup> favours dissociation rather than autodetachment;
- K<sup>+</sup> may delay autodetachment, allowing for intramolecular electron transfer
- Branching ratios (uncertainties up to 20%) and the collision dynamics;
- Provide K<sup>+</sup> energy loss profiles.
